

OCT glaucoma classification

2D / 3D features + gated cross-attention

Feature blocks / grids are schematic, not measured activations or a linear size scale. LN2d = LayerNorm2d; GAP = global average pooling.
Texture source: raw_2404.npy; cube = two central B-scans + Full AIP, contrast-adjusted for display. MaxViT stems are omitted visually.
MaxViT weights are independent. Paired training augmentation precedes /255; bilateral affects only 3D. Dashed arrows: notebook post-processing.
T is fitted on validation logits; tau is tuned before validation calibration but applied after test calibration (existing protocol mismatch).
