

From the retinal scan region to OCT slices

(a) Location in the eye

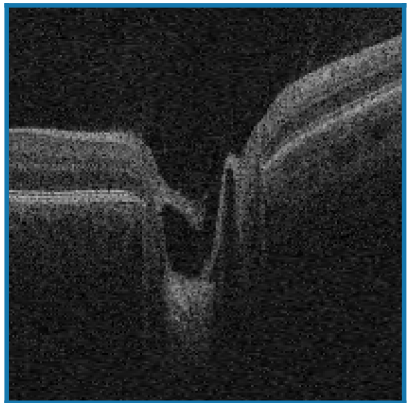

(b) Acquired OCT voxel block

X, Y: lateral scan coordinates
Z: depth into the retinal tissue

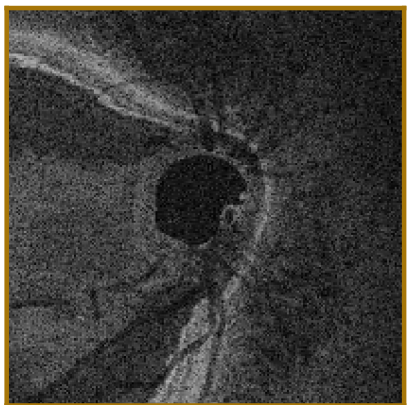

(c) Sections of the same block
 $YZ \mid X = 100$

$XZ \mid Y = 100$

$XY \mid Z = 80$

The OCT block covers a small retinal region, not the whole eye.

Eye drawing: anatomical schematic, not patient-specific registration.
Block and slices: original Harvard-GF voxel intensities; voxel units, not millimeters.
